The 'Global Monitoring for Environment and Security' (GMES) represents a concerted effort to bring data and information providers together with users, so they can better understand each other and make environmental and security-related information available to the people who need it through enhanced or new services.

## EVENTS ANNOUNCEMENTS

### The data

### Data access

## Today: Interactive, user adapted, EO data content access

Suggest data

Mine Fields (Daedalus)

Access to:  
information  
knowledge

Knowledge share

Help to image understanding

## Postulates

Existing volume of unstructured data prevents any systematic exploitation of its information content.

Information extraction depends critically on the descriptive or predictive accuracy of the stochastic model employed.

The augmentation of the data with meaning, e.g. image understanding, can be interpreted as a **coding** task which includes the model of user's conjecture.

## Paradox

People have trouble in caching more than **7 items** at a time.  
We design systems to enable people to access **1000 TB**.

# The KEO Vision

## KEO - Knowledge centred Earth Observation

***"The information extraction process must be replaced by more automated, direct and human centred methods"***

## Automated, Direct and Human Centred

- **"Automated"** is a consequence of the data size / complexity and of the cost of the non-automatic process.
- **"Direct"** responds to the need in order to reduce the steps between the user and the information.
- **"Human centred"** brings the focus on systems that could be managed also by non-EO experts via **semantic** interactions.

# Archives and Libraries

- **Archive:** a long-term **storage** area, place or collection containing records, documents, or other materials of **historical** interest (that's passive and static!)
- **Library:** a **depository** built to contain books and other materials **for reading and study** (that's active and dynamic!)

## What makes the difference?

- **Library has:**
  - **A catalogue (better than archives):** indexing books based on multiple criteria, e.g. author, title, keywords, domains (ontology!)
  - **A librarian:** one who has the care of a library and **its contents**, **selecting** the books, documents and non-book materials which comprise its collection, and **providing information** and loan services **to meet the needs of its users**

# Searching Libraries

- **Use the catalogue:** select indexes and search the books. Next, read them.
- **Walk trough the library:** browse till you get interested...
- ***A friend told me...***: go to the material using prior information
- ***Ask the librarian:*** the *ideal* librarian, he
  - reads all the incoming books
  - interprets contents
  - associate with other information
  - creates categories
  - understand the inquiry
  - dialogues
  - comments, and
  - suggest ...

# Searching Libraries

Description

## Image semantics

- a fundamental difference of an **image vs. a database record (a book)** is their different **status as signs**
- Information in images is contextually incomplete: taken isolated, **images** have no assertive value but **rely on some external information**
- the drawback of **images** comes from semantic assumptions
- **thus, the need for redefining the concept and role of meaning**

# A Mathematical Theory of Communication

By C. E. SHANNON

## INTRODUCTION

THE recent development of various methods of modulation such as PCM and PPM which exchange bandwidth for signal-to-noise ratio has intensified the interest in a general theory of communication. A basis for such a theory is contained in the important papers of Nyquist<sup>1</sup> and Hartley<sup>2</sup> on this subject. In the present paper we will extend the theory to include a number of new factors, in particular the effect of noise in the channel, and the savings possible due to the statistical structure of the original message and due to the nature of the final destination of the information.

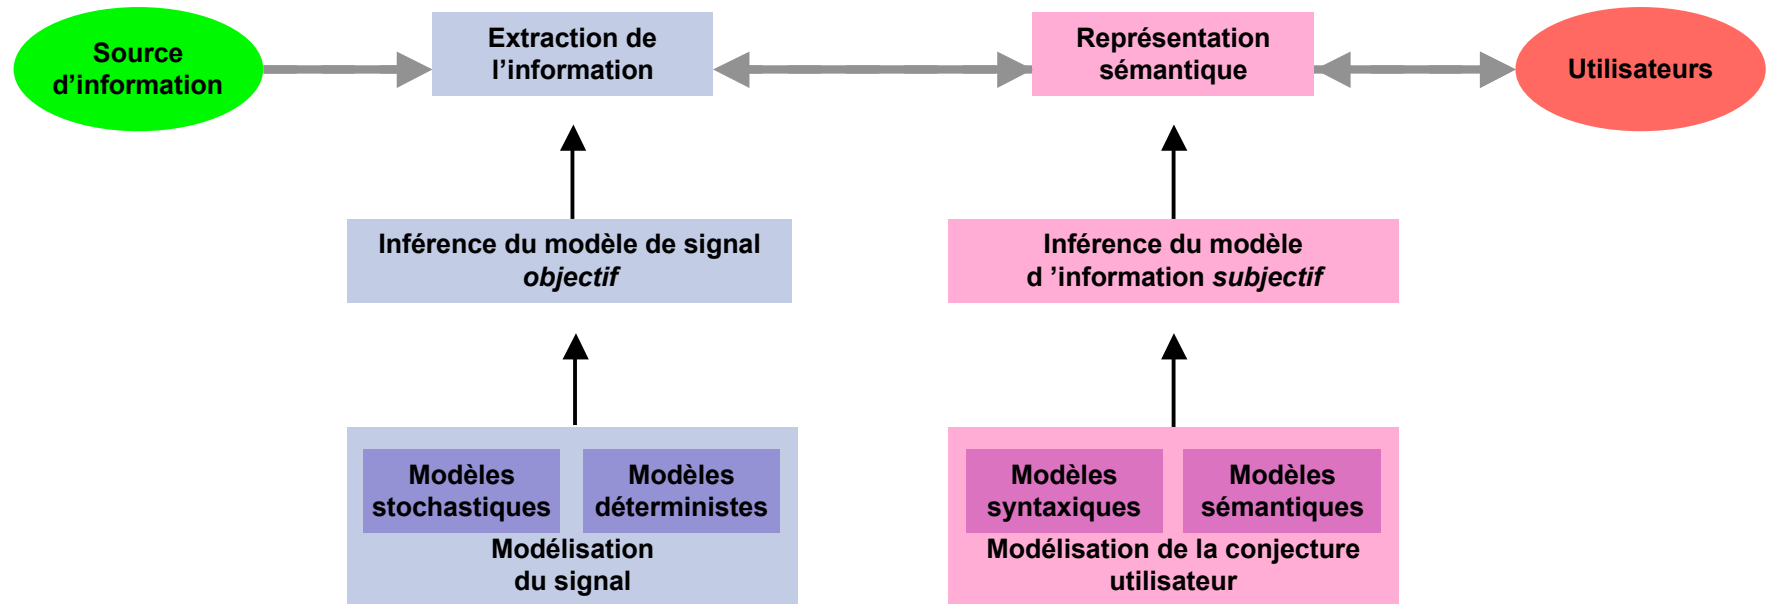

The fundamental problem of communication is that of reproducing at one point either exactly or approximately a message selected at another point. Frequently the messages have *meaning*; that is they refer to or are correlated according to some system with certain physical or conceptual entities. These semantic aspects of communication are irrelevant to the engineering problem. The significant aspect is that the actual message is *one selected from a set* of possible messages. The system must be designed to operate for each possible selection, not just the one which will actually be chosen since this is unknown at the time of design.

## Semantics

- **semantics** emerge (only) by interactions between **human and machine**
- there is a knowledge **acquisition bottleneck** for semantics-based applications
- **learning the interactions** between machine and human makes **semantic emerge**
- semantics in the frame of ontologies, **give models** that provide abstractions of the world

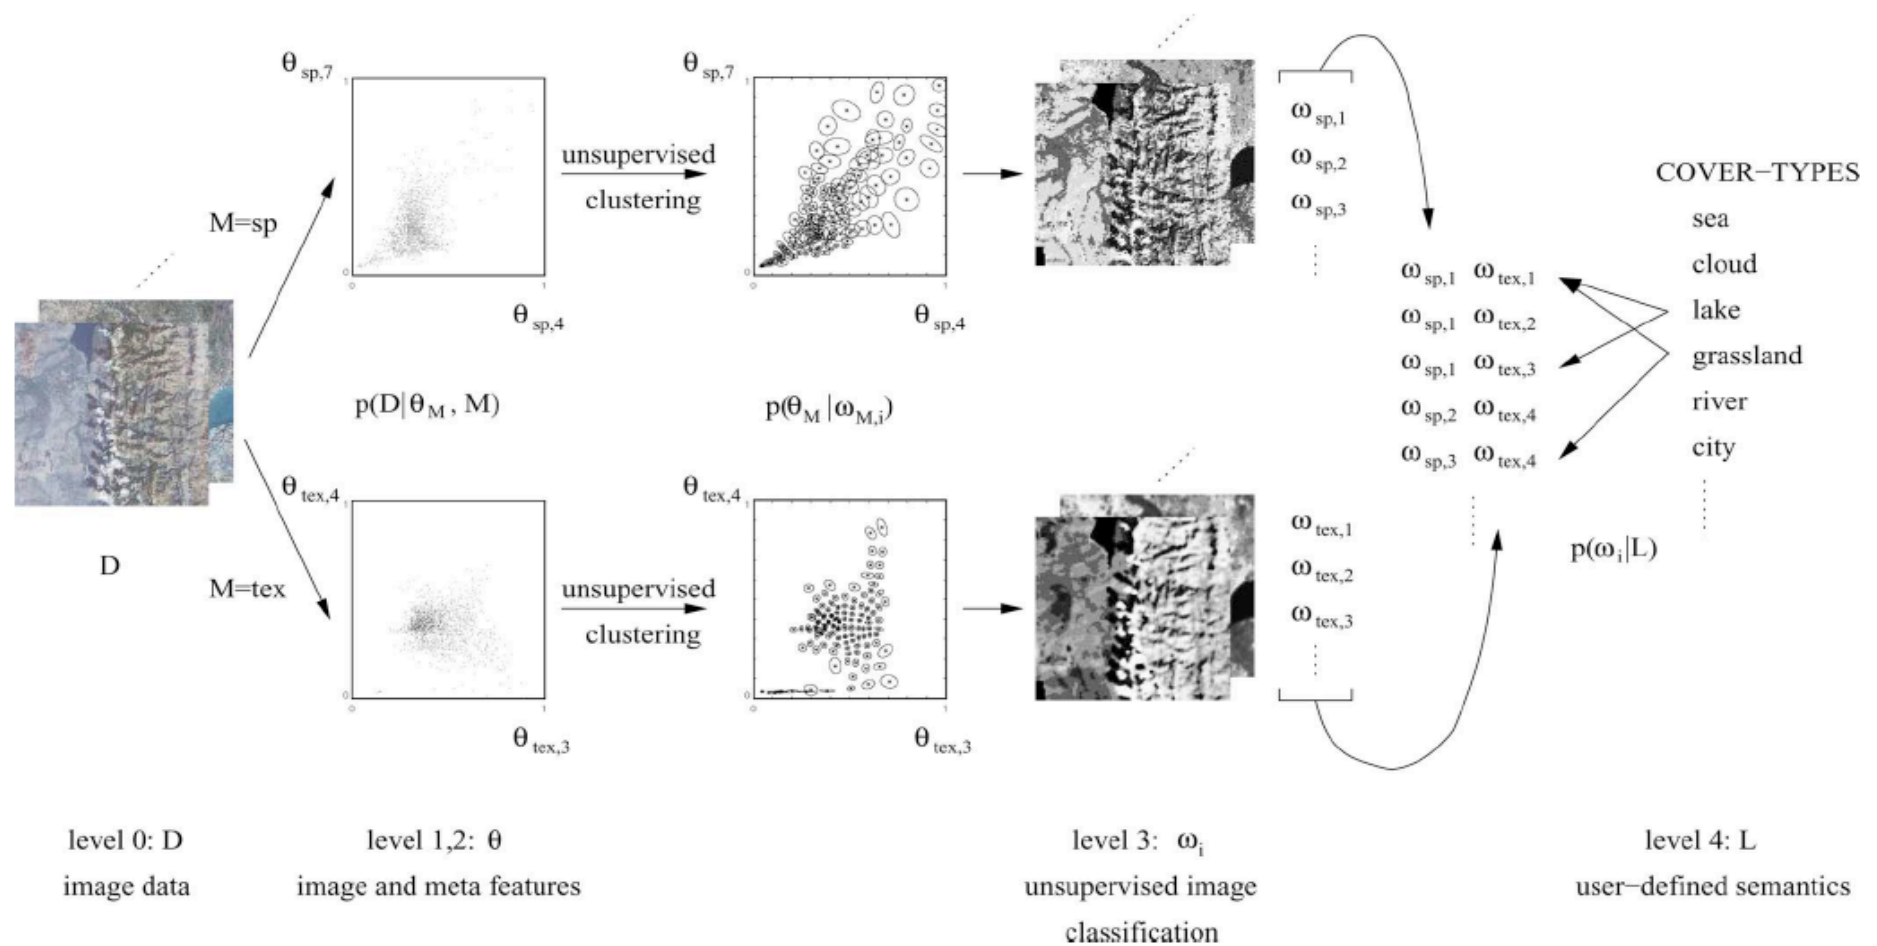

## CONCEPT DE COMMUNICATION AVANCE

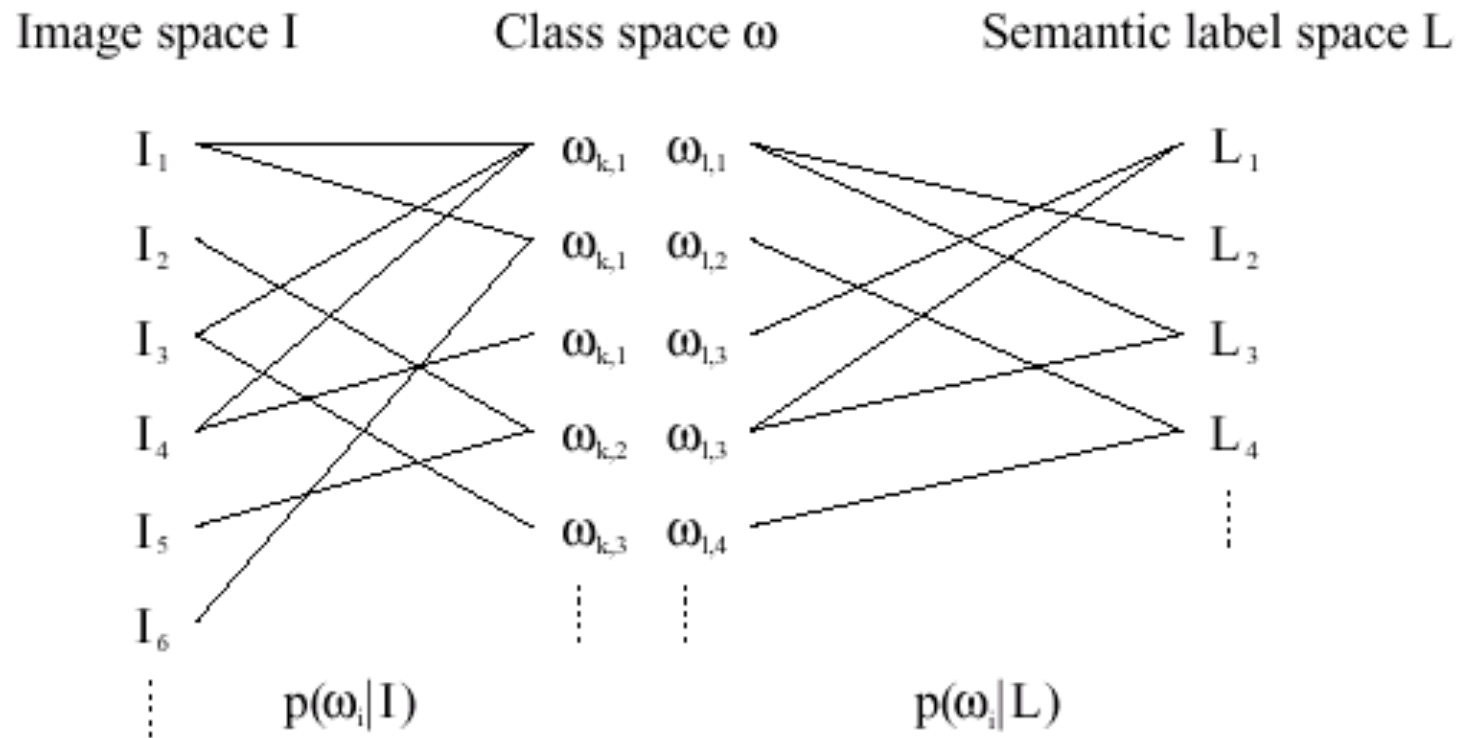

### The principle of semantic compositionality:

*the meaning of a whole is a function of the meanings of its parts and  
their mode of syntactic combination*

## KIM hierarchical information representation: coding

# Coding

## Semantic coding: Dirichlet model

- after  $N_i$  instances the likelihood is

$$\begin{aligned} p(\boldsymbol{\theta}|T) &= \frac{p(T|\boldsymbol{\theta}) \cdot p(\boldsymbol{\theta})}{p(T)} \\ &= \frac{\Gamma(r + N)}{\prod_i \Gamma(1 + N_i)} \prod_i \theta_i^{N_i} \\ &= \text{Dir}(\boldsymbol{\theta}|1 + N_1, \dots, 1 + N_r) \end{aligned}$$

$$\begin{aligned} p(\boldsymbol{\theta}|T', T) &= \frac{p(T'|\boldsymbol{\theta}, T) p(\boldsymbol{\theta}|T)}{p(T', T)} \\ &= \text{Dir}(\boldsymbol{\theta}|\alpha_1 + N'_1, \dots, \alpha_r + N'_r) \end{aligned}$$

$$p(\omega_i|A_\nu, T) = \frac{\alpha_i}{\alpha}$$

# Semantic coding

river

spectral

texture

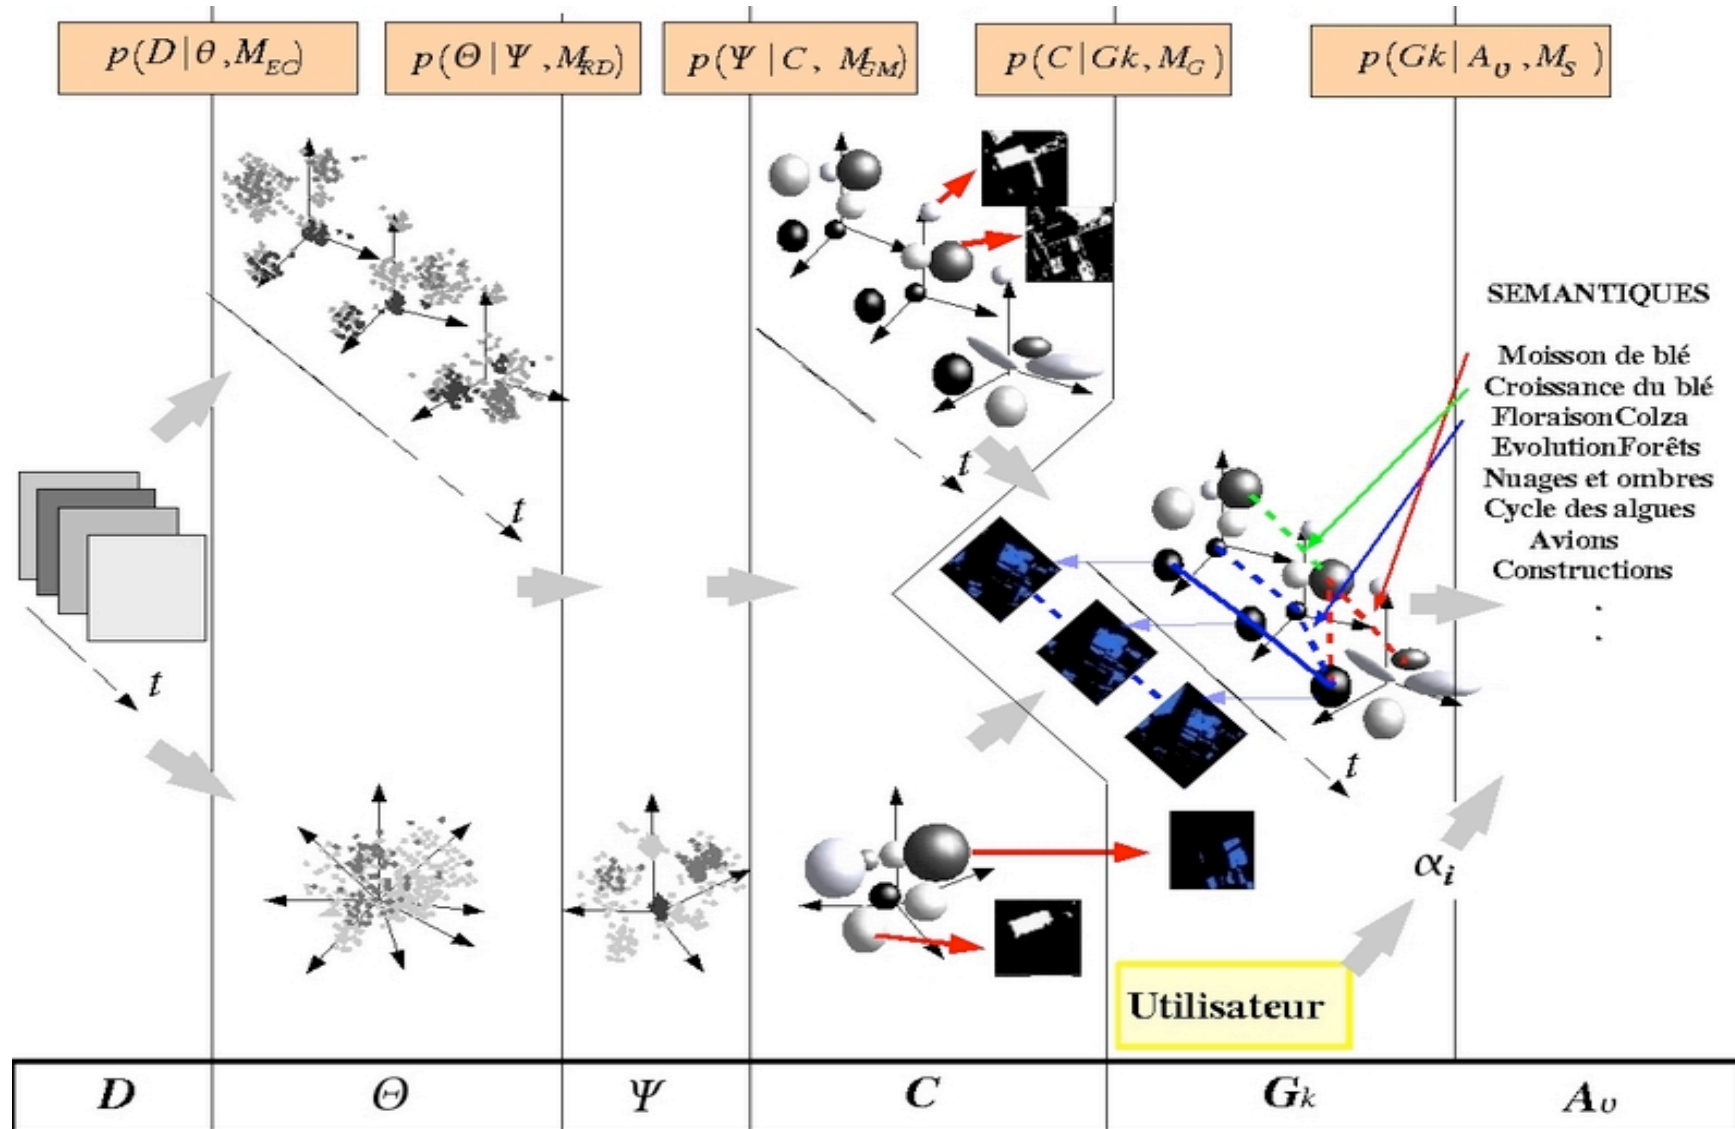

## Satellite Image Time Series (CNES, SPOT images, Bucharest)

# Spatio-temporal data modelling

## Semantic coding

- On définit une **transformation composée d'opérations élémentaires**

$$f : v^0 \rightarrow v^{k\lambda} = v^k \cup \lambda$$

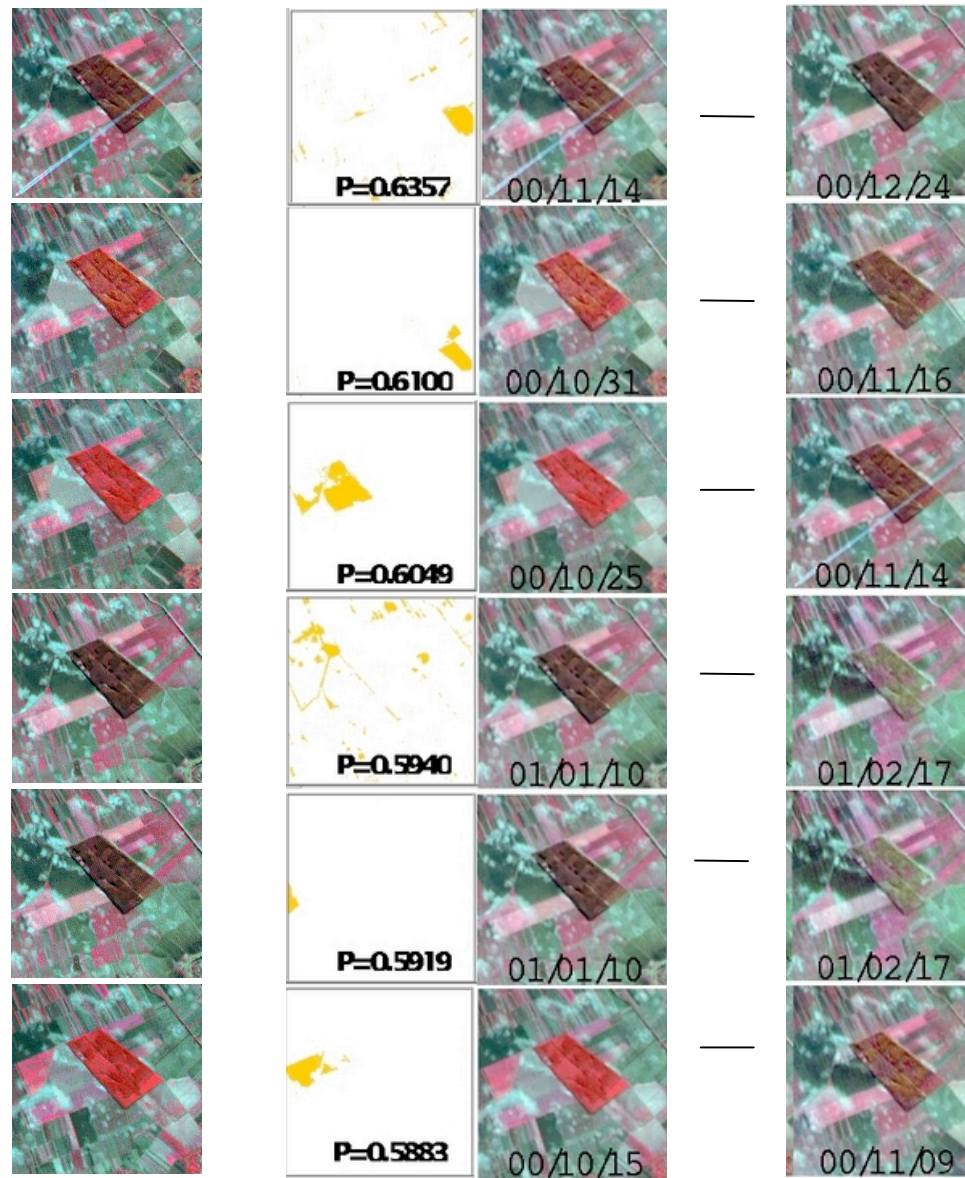

de coût égale à une **somme pondérée de coût partiels** relatifs aux similarités entre les différents attributs de graphes (différence, divergence de Kullback-Leibler) :

- Apprentissage interactif de la distribution  $p(\omega \mid T)$**

a priori conjugué de **Dirichlet** :  $p(\omega)$

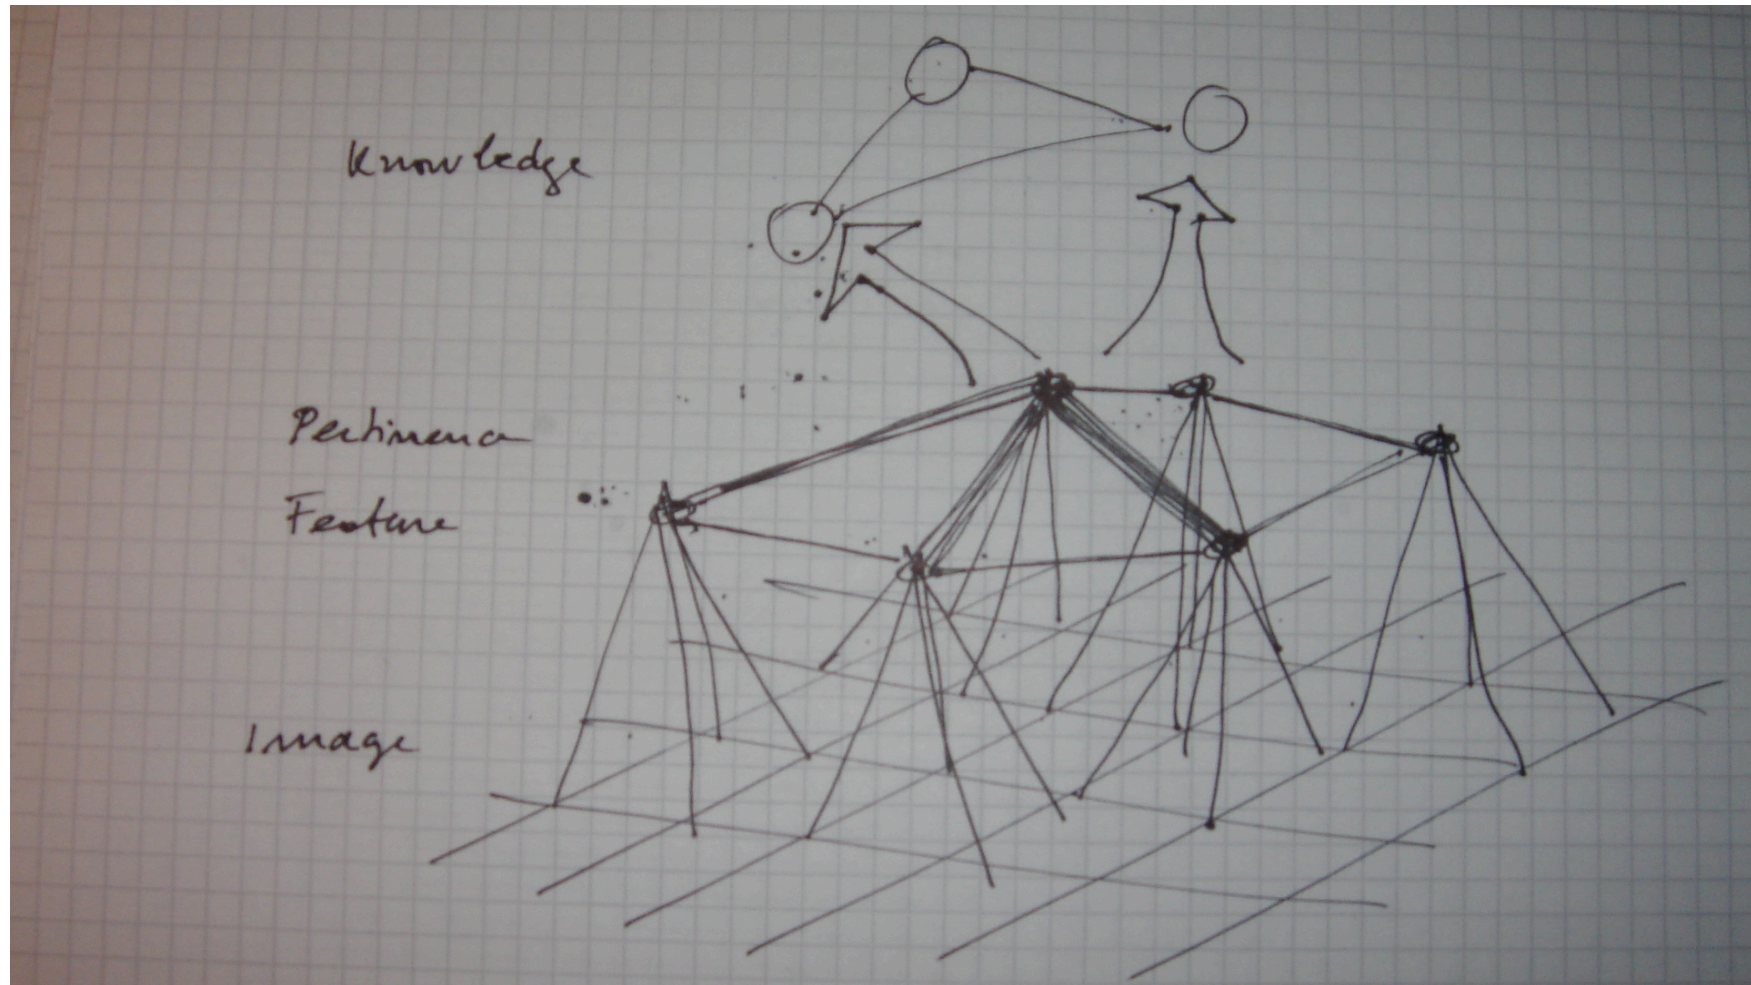

$$p(\omega \mid T^{(1)}) = \text{Dir}(\omega \mid 1 + N_1^{(1)}, \dots, 1 + N_r^{(1)}).$$

# Semantic coding

## Spatial semantic coding

## Spatial Semantics based on a syntax model

## Overview

**Stochastic modelling:** telecommunications, geosciences, bio-medicine, multimedia, social and economic sciences, etc.

**Image information:** acquisition, processing, visualization, and analysis of spatial information. Thus modelling and understanding.

Statistical modeling: discover **regularities** in observed data. The more regularities are found in the data, the more data can be **compressed**. Finding regularities in the data means nothing else but to **learn** about the data.

**Links** between **stochastic modelling, information theory, and machine learning**, provided new basic theories for information processing and understanding.
